

Graduate Operating Systems

Fall 2021

1

Paper “Survey”

- Why simulating computer X on computer G?
- What if $X = G$, why is that useful?
- Virtual machine system, virtual machine (VM), virtual machine monitor (VMM)
- IBM example: security, reliability, development costs

2

Paper “Survey”

- Principles

- Dual-mode systems

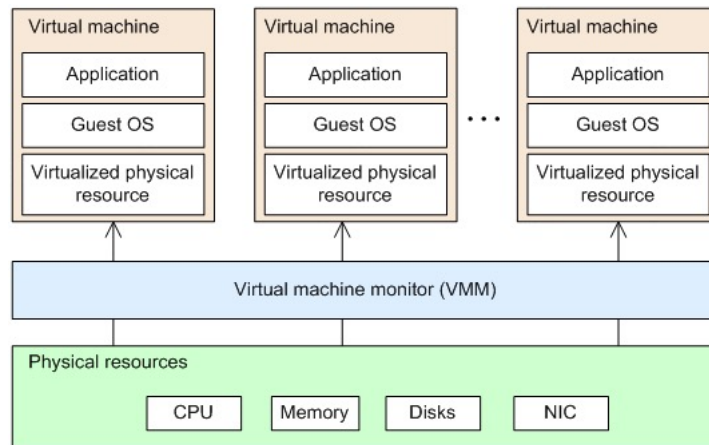

- Figure 1: “single-kernel approach”

- Figure 2: “multi-kernel approach”

- Combination of **VM, Multiprogramming, Virtual Storage**

3

Paper “Survey”

4

Paper “Survey”

- Computer architecture generations
 - Vacuum tubes, transistors, ICs, microprocessors, (AI/massively parallel/...)
- Virtual mode bit
- **Trap & emulate**
- **Virtualizable architectures** (direct support of VMs)
- **What are reasons for poor performance of VMs?**
- Performance:
 - Policies (e.g., “virtual = real”), interface (“special calls” for improved performance), new mechanisms (e.g., firmware support)

5

Paper “Survey”

- Installation management, release trauma
- Retrofitting old systems
- Development and testing
- Education
- Reliability (isolation)
- Security

6

Paper “VMM”

- Reasons for VM revival
 - Underused resources
 - Management overheads
 - Fragility, vulnerability
- “One app per machine” model
- Now: **hardware multiplexing; security & reliability**
- Encapsulation and migration
- Replication
- Suspend and resume
- Strong isolation

7

Paper “VMM”

- “Virtualizable”: direct execution supported (VM executing on real machine, while VMM has ultimate control of CPU); VM’s privileged and unprivileged code runs in CPU’s unprivileged mode (VMM runs in privileged)
- Sensitive instructions S
- Privileged instructions P
- **Virtualizable if S subset of P**

8

Paper “VMM”

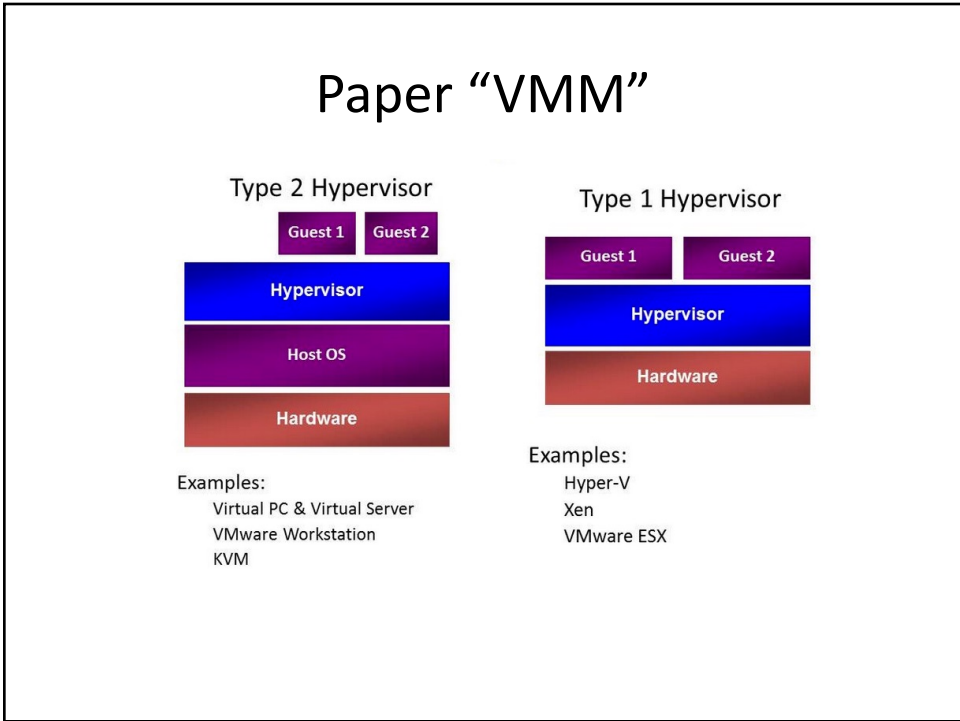

- Example of disabling interrupts
- X86: POPF, code segment register
- Paravirtualization
 - What is the biggest drawback?
- Direct execution + fast binary translation
 - Trace cache

9

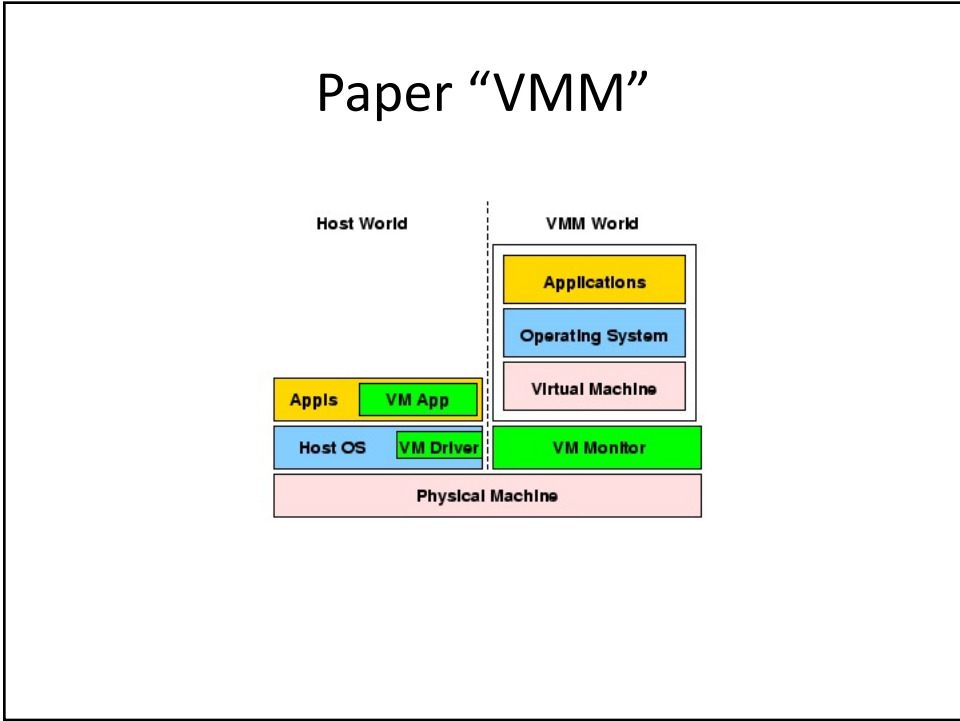

Paper “VMM”

- Memory virtualization
 - Shadow page table
 - Balloon process
- I/O virtualization
 - Hosted architecture
 - Type 1 hypervisor
