- **Which one did you like the most?**

Sorting Real Numbers

- **Real numbers** are infinite precision numbers and in some cases cannot be written down in their entirety.
- **Theorem:** There are an uncountable number of real numbers between any two real numbers.
- In particular, real numbers **cannot** be sorted using **Bucket sort** or **radix sort** or **counting sort** even if they are within a range.
- **Real numbers** stored on a real computer are not really “real numbers” because they are finite precision numbers. We can only approximate real numbers using a computer. **Integers** can be stored precisely on a computer. The integer n can be stored using roughly $\log_2 n$ bits.

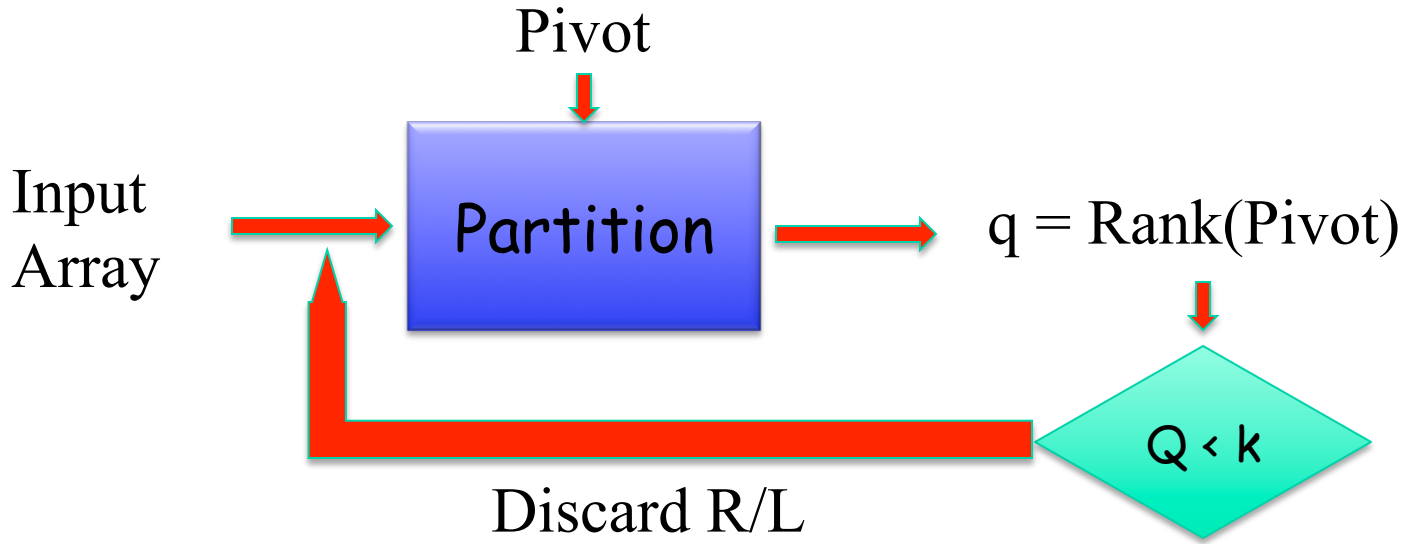

k-Selection & Median: Improved Algorithm

- Start with initial array

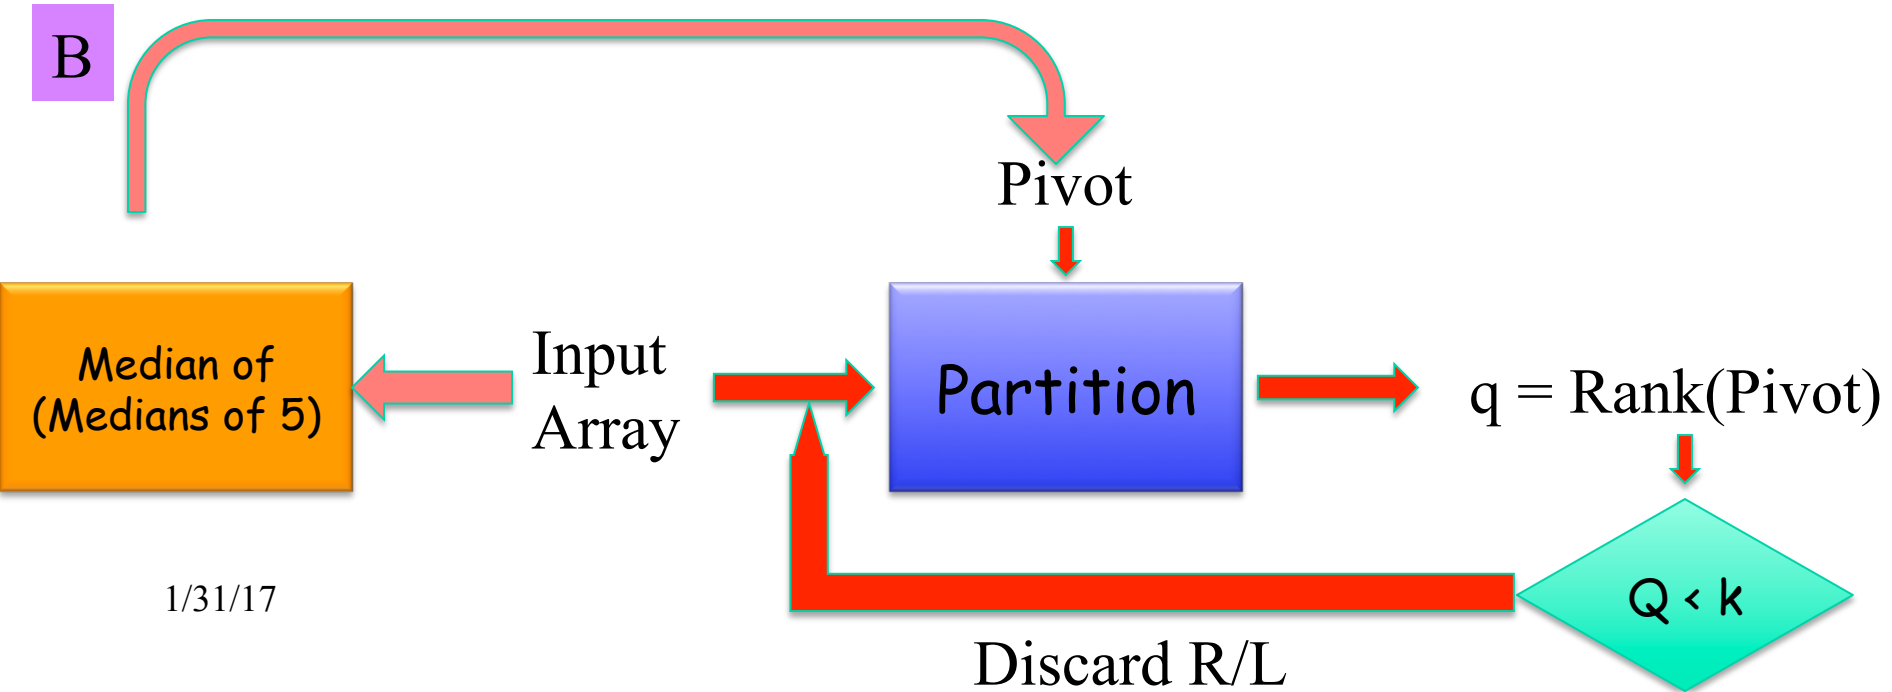

QuickSelect (A) & Improved Median (B)

A

B

k-Selection & Median: Improved Algorithm(Cont' d)

- Use median of medians as pivot

- $T(n) < O(n) + T(n/5) + T(3n/4)$
- Only way to solve is using the "Substitution Method"
- Solution: $T(n) = O(n)$
- Constants are large

ImprovedSelect

IMPROVEDSELECT(*array* A , *int* k , *int* p , *int* r)

▷ Select k -th largest in subarray $A[p..r]$

```
1  if ( $p = r$ )
2    then return  $A[p]$ 
3    else  $N \leftarrow r - p + 1$ 
4    Partition  $A[p..r]$  into subsets of 5 elements and
   collect all medians of subsets in  $B[1..\lceil N/5 \rceil]$ .
5     $Pivot \leftarrow$  IMPROVEDSELECT( $B$ , 1,  $\lceil N/5 \rceil$ ,  $\lceil N/10 \rceil$ )
6     $q \leftarrow$  PIVOTPARTITION( $A$ ,  $p$ ,  $r$ ,  $Pivot$ )
7     $i \leftarrow q - p + 1$     ▷ Compute rank of pivot
8    if ( $i = k$ )
9      then return  $A[q]$ 
10   if ( $i > k$ )
11     then return IMPROVEDSELECT( $A$ ,  $k$ ,  $p$ ,  $q - 1$ )
12     else return IMPROVEDSELECT( $A$ ,  $k - i$ ,  $q + 1$ ,  $r$ )
```

PivotPartition

PIVOTPARTITION(*array A, int p, int r, item Pivot*)

▷ Partition using provided *Pivot*

1 $i \leftarrow p - 1$

2 **for** $j \leftarrow p$ **to** r

3 **do if** ($A[j] \leq Pivot$)

4 **then** $i \leftarrow i + 1$

5 exchange $A[i] \leftrightarrow A[j]$

6 **return** $i + 1$

Data Structure Evolution

- Standard operations on data structures
 - **Search**
 - **Insert**
 - **Delete**
- Linear Lists
 - Implementation: **Arrays** (Unsorted and Sorted)
- **Dynamic** Linear Lists
 - Implementation: **Linked Lists**
- **Dynamic** Trees
 - Implementation: **Binary Search Trees**

BST: Search

TREESearch(*node x*, *key k*)

▷ Search for key k in subtree rooted at node x

1 **if** $((x = \text{NIL}) \text{ or } (k = \text{key}[x]))$

2 **then return** x

3 **if** $(k < \text{key}[x])$

4 **then return** TREESearch($\text{left}[x]$, k)

5 **else return** TREESearch($\text{right}[x]$, k)

Time Complexity: $O(h)$

h = height of binary search tree

Not $O(\log n)$ — Why?

BST: Insert

TREEINSERT(*tree T, node z*)

▷ Insert node z in tree T

1 $y \leftarrow \text{NIL}$

2 $x \leftarrow \text{root}[T]$

3 **while** ($x \neq \text{NIL}$)

4 **do** $y \leftarrow x$

5 **if** ($\text{key}[z] < \text{key}[x]$)

6 **then** $x \leftarrow \text{left}[x]$

7 **else** $x \leftarrow \text{right}[x]$

8 $p[z] \leftarrow y$

9 **if** ($y = \text{NIL}$)

10 **then** $\text{root}[T] \leftarrow z$

11 **else if** ($\text{key}[z] < \text{key}[y]$)

12 **then** $\text{left}[y] \leftarrow z$

13 **else** $\text{right}[y] \leftarrow z$

Time Complexity: $O(h)$

h = height of binary search tree

Search for x in T

Insert x as leaf in T

BST: Delete

Time Complexity: $O(h)$

h = height of binary search tree

TREEDeLETE(*tree T, node z*)

▷ Delete node z from tree T

```
1  if ((left[z] = NIL) or (right[z] = NIL))
2    then  $y \leftarrow z$ 
3    else  $y \leftarrow \text{TREE-SUCCESSOR}(z)$ 
4  if (left[y]  $\neq$  NIL)
5    then  $x \leftarrow \text{left}[y]$ 
6    else  $x \leftarrow \text{right}[y]$ 
7  if ( $x \neq \text{NIL}$ )
8    then  $p[x] \leftarrow p[y]$ 
9  if ( $p[y] = \text{NIL}$ )
10   then  $\text{root}[T] \leftarrow x$ 
11   else if ( $y = \text{left}[p[y]]$ )
12         then  $\text{left}[p[y]] \leftarrow x$ 
13         else  $\text{right}[p[y]] \leftarrow x$ 
14  if ( $y \neq z$ )
15   then  $\text{key}[z] \leftarrow \text{key}[y]$ 
16        cop  $y$ 's satellite data into  $z$ 
17  return  $y$ 
```

Set y as the node to be deleted.
It has at most one child, and let
that child be node x

If y has one child, then y is deleted
and the parent pointer of x is fixed.

The child pointers of the parent of x
is fixed.

The contents of node z are fixed.
