Applications of Online Algorithms

k-Server Problem

Algorithms for *k*-Server Problem

Offline Algorithms

RANDOM Algorithm

- On a miss: evict a random item from cache.
- RANDOM is k-competitive

Randomized MARKER Algorithm

- Each of k pages in cache has a MARKer bit
- In each phase
 - If start of phase: UNMARK all pages
 - If request is a hit: MARK the page
 - If request is a miss:
 - 1 Replace random UNMARKed page; MARK new page;
 - 2 If all pages MARKed, start new round; UNMARK all pgs;
- MARKER algorithm is 2H_k-competitive.

of Online Algorithms

k-Server Problem

Algorithms for *k*-Server Problem

Offline Algorithms

- In analyzing randomized online algs, we have 3 choices:
 - Oblivious adversary: adversary generates request sequence at start. I.e., cannot see action of algorithm or random choices. Adversary serves offline.
 - Adaptive online adversary: adversary generates request sequence adaptively (online). I.e., can see action, but not random choices. Adversary serves online
 - Adaptive oine adversary: adversary generates request sequence adaptively, and knows the result of the coin tosses. Adversary serves offline
